

**Label failures, wrong or missing parts
make our products useless**

Let's avoid these failures and go towards excellence

Wrong product /variant

Missing part

Wrong label

Weidmüller 

Wrong label

A wrong label seems to be an uncritical failure at the first glance. But the label is identifying the product. That means a customer gets the wrong product if the label is wrong. A wrong product is useless for the customer and may lead to production interruptions or intensive rework.

Place the right labels on the product and the packaging !

Orange products are indicated on the label.

Black products are indicated on the label.

Wrong product variant

Wrong part in a packaging

Wrong marking

Missing part

A missing part on a product is like trying to drive a car without steering wheel. Major or minor functions of the product are not given, the product might be useless for the customer.

One of the main reasons for missing parts are unsecured assembly processes, very often hand-assemblies without any automated inspections.

Assembly the products correctly as specified. Do not forget any parts.

Missing screw

Missing nut

Wrong product /variant

Manufacturing things right is a tough challenge. Mostly we get it right. Mixing things is sometimes advantageous, but not always acceptable. In increasingly automated assembly lines each and every wrong or mixed part leads automatically to a delay. This can be very costly for our customers and therefore parts can be costly for us too! Unacceptable mixing occurs also when bad parts contaminate batches of otherwise good parts. We must do our utmost to ensure that processes deliver only what the customer ordered.

**Focus on the specification.
Do not mix up products and parts.**
